DNA Cell Biol. (1991) 10:671-679

Gene expression and cDNA cloning identified a major basic
protein constituent of bovine seminal plasma as bovine
monocyte-chemoattractant protein-1 (MCP-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           #product monocyte chemoattractant protein 1 #status

NAF(44-75) is a preferred peptide derived from NAF which is nartagonistic to NAF and has no chemotactic activity. It inhibited NAF-induced migration by 34 per cent. When used with a second preferred peptide, i.e. NAF(3-25) (see R20236) inhibition was 70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W04515;

Synthesis of protein by chemical ligation of unprotected peptide(s)

Py reaction of N-terminal Cys with C-terminal thioester and

Py reaction of N-terminal Cys with C-terminal thioester and

Example 3; Page 47; 61pp; English

The present peptide, which has an amino-terminal cysteine residue,

The present peptide, which has an amino-terminal cysteine residue,

The present peptide (OP) to a 2nd OP, end to end, to produce an OP

Stoduct. This comprises mixing the 1st and 2nd OP (which have a product. This comprises mixing the 1st and 2nd OP (which have a carboxy-terminal thioester and an amino-terminal Cys with an unoxidised SH side chain) in a solution containing a catalytic of thiol, condensing the terminal groups to form an intermediate OP,

The method can be used for the production of full length proteins, which can be made into native, disulphade containing proteins by compressing the size of protein that can be made by chemical companies chamoselective, compensation that can be made by chemical can be made into native, and the native peptide bond formation, with native peptide bond formation, companies chamoselective, contens the components are size of protein that can be made by chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 23; Page 30; 47pp; English.
The sequence is that of an analogue of interleukin-8 (IL-8) comprising residues 3-69. It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat at inflammation, e.g. by intravenous injection or oral admin. It can inflammatory response.

New interleukin-8 analogues modified in specified region - used as neutrophil activators or for blocking effect of IL-8 on neutrophil(s) for treatment of inflammation claim 19; Page 29; 47pp; English.

The Sequence is that of an analogue of interleukin-8 (IL-8) comprising IL-8 residues 6-72. It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat act as a neutrophil eact as a neutrophil activator and so can be used to stimulate an inflammatory response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for treatment of inflammation

Claim 17: Page 29: 47pp: English.

The sequence is that of an analogue of interleukin-8 (IL-8) comprising to a residues 5-72: It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat inflammation, e.g. by intravenous injection or oral admin. It can at a neutrophil activator and so can be used to stimulate an inflammatory response. It also has strong chemotaxis activity and sequence 68 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Clark-Lewis I, Moser B, WPI: 93-196997/24.

New interleukin-8 analogues modified in specified region - used as neutrophil activators or for blocking effect of IL-8 on neutrophil(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

The sequence is that of an analogue of interleukin-8 (IL-8) comprising IL-8 residues Gln5 (6-72). It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat inflammation, e.g. by intravenous injection or oral admin. It can
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 15; Page 29; 47pp; English.

The sequence is that of an analogue of interleukin-8 (IL-8) comprising IL-8 residues IL-8 (6-72). It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat inflammation, e.g. by intravenous injection or oral admin. It can act as a neutrophil activator and so can be used to stimulate an

New interleukin-8 analogues modified in specified region - used as neutrophil activators or for blocking effect of IL-8 on neutrophil(s) for treatment of inflammation for treatment of inflammation. The sequence 19; 47pp; English. The sequence is that of an analogue of interleukin-8 (IL-8) comprising IL-8 residues 4-72. It is able to bind neutrophils and act as a competitive antagonist of IL-8, i.e. it can be used to treat inflammation, e.g. by intravenous injection or oral admin. It can act as a neutrophil activator and so can be used to stimulate an inflammatory response. Sequence 69 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Clark-Lewis I, Moser B;

                Claim 10; Page 29; 47pp; English.

The sequence is that of an analogue of interleukin-8 (IL-8) comprising The sequence is that of an analogue of interleukin-8 (IL-8) comprising as a competitive antagonist of IL-8, i.e. it can be used to treat inflammation, e.g. by intravenous injection or oral admin. It can act as a neutrophil activator and so can be used to stimulate an inflammatory response.
                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-WAR-1997 (first entry)

Claim 1: Column 4: 8pp: English.
A novel antibody, preferably a monoclonal Ab (MAb), has specific
binding affinity for a neutrophil chemotactic factor (NCF) having
the present amino-terminal sequence. The MAb can be used to
quantify, detect or localise the NCF in a sample, and treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-neutrophil chemotactic factor antibody - useful to assay for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-NOV-1990 (first entry)
Sequence of a synthetic neutrophil chemotactic polypeptide (NCF)
Inflammation; anti-neutrophil chemotactic polypeptide antibody.
 or to detect, isolate and expand progenitor cells ex vivo for transplantation. The protein does not show adverse neutrophil activation or inflammatory side-effects.
                                                                                                                   ;

Claim 1; Page 35; 40pp; English.
The sequences given in W25701-14 represent interleukin-8 (IL-8) mutants which are capable of binding to IL-8 receptors. They can be used for modulating an IL-8 receptor-mediated biological response.
The mutantions were introduced into the human IL-8 coding sequence by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Claim 1; Page 35; 40pp; English.

The sequences given in W25701-14 represent interleukin-8 (IL-8) mutants which are capable of binding to IL-8 receptors. They can be used for modulating an IL-8 receptor-mediated biological response. The mutations were introduced into the human IL-8 coding sequence by
Claim 1; Page 35; 40pp; English.

The sequences given in W25701-14 represent interleukin-8 (IL-8)
mutants which are capable of binding to IL-8 receptors. They can
be used for modulating an IL-8 receptor-mediated biological response.

The mutations were introduced into the human IL-8 coding sequence by

protein - protein database search, using Smith-Waterman algorithm MPsrch_pp

Fri Feb 4 17:15:49 2000; MasPar time 3.23 Seconds 105.016 Million cell updates/sec Run on:

Tabular output not generated.

>US-09-150-813-41 (1-12) from US09150813.pep 92 Description: Perfect Score:

1 EICLDPEAPFLK 12 Sequence: 77977 seqs, 28268293 residues Searched:

PAM 150 Gap 15

Scoring table:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot37 1:swissprot

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 25.651; Variance 29.190; scale 0.879

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm Fri Feb 4 17:15:11 2000; MasPar time 3.59 Seconds 133.808 Million cell updates/sec Run on:

Tabular output not generated.

>US-09-150-813-41 (1-12) from US09150813.pep 92 1 EICLDPEAPFLK 12 Description: Perfect Score: Sequence: Title:

Scoring table:

PAM 150 Gap 15

122810 seqs, 40068593 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

Mean 24.908; Variance 32.652; scale 0.763 pir60 1:pirl 2:pir2 3:pir3 4:pir4

Statistics:

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

There ampeters to be a second beta-thromboglobulin-like human gene.

There ampeters to be a second beta-thromboglobulin-like human gene.

Connective-tissue activating peptides (CTAP) are a group of proteins capable of activating connective tissue cells. CTAP-I,

'II, 'III and 'P2, and 'PMN are of lymphoid, tumor cell, human platelet, and polymorphonuchear leukocyte origin, respectively.

TAP-III, a monomer isolated from platelets, stimulates DNA synthesis, mitosis, glycolysis, intracellular cAMP accumulation, prostaglandin E2 secretion, and synthesis of hyaluronic acid and secretion of plasminogen activator by human synovial cells.

Protecolytic removal of the first four residues of CTAP-III produces the active peptide beta-thromboglobulin, which is released from platelets along with platelet factor 4 and platelet-derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacza, M.L.; Reddigari, S.R.; Kornfeld, D.; Ramani, N.;

Pure mammalian granulocyte chemotactic protein-2 - which stimulates granulocytes to secrete protease, used to develop prods. for treating inflammatory conditions
Disclosure; Page 29; 54pp; English.

Human GCP-2 was isolated from human MG-63 osteosarcoma (ATCC CRL 1427) cells, and cattle GCP-2 (R55844) from MDBK (ATCC CRL 6071) GCP-2 were also isolated and sequenced (R55845, 77, R55849).

Conserved region within mammalian GCP-2 is shown in sequence R55848.

Expression of DNA encoding GCP-2 in a host cell will provide
                                                                                                                                                                                      29-AUG-1995 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                               potentially useful for treating arthritis, restenosis, cancer. Claim 12; Page 43; 60pp; English.
Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in RVOT86-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced Sequence 78 AA;
                                                                                                                                                                                                                                                                                                                                                                                                               Screening for cpds. with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation,

                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pure mammalian granulocyte chemotactic protein-2 - which pure mammalian granulocytes to secrete protease, used to develop stimulates granulocytes to secrete protease, used to develop prods. for treating inflammatory conditions
Disclosure; page 29; 54pp; English.

Human GCP-2 (R5643) was isolated from human MG-63 osteosarcoma (ATCC CRL 1427) cells, and cattle GCP-2 from MDBK (ATCC CRL 6071)

CATC CRL 1427) cells, and cattle GCP-2 from MDBK (ATCC CRL 6071)

CATC CRL 1427) cells, and cattle GCP-2 from MDBK (R56845-47, R55849). A conserved region within mammalian GCP-2 is shown in sequence R55848. Expression of DNA encoding GCP-2 in a host cell will provide recombinant protein of use as an antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps
  family of chemokines, has similarity to other alpha-intercrines involved in the chemo-attraction and activation of leukocytes. The nucleic acid sequence encoding NGCP and the protein can be used in the diagnosis and treatment of diseases such as leukaemia and other cancer, immune deficiencies or excessive immune responses. Sequence 114 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         abnormal cell proliferation; regeneration; degeneration; atrophy

The present sequence represents mouse CKDLR201.1 chemokine protein which comprises a plurality of epitopes. Host cells containing vectors which comprises a plurality of epitopes. Host cells containing vectors comprising a nucleotide sequence encoding the protein are used to containing a nucleotide sequence encoding the protein are used to produce recombinant protein. Treatment of a cell, particularly neuron, car receptor responsive to CKDLR201.1 chemokine protein, with an or a receptor responsive to CKDLR201.1 chemokine protein, with an cell appoints its used to control physiological development, e.g. alteration of calcium ion influx, a chemoattractant response, morphology, alteration of calcium ion influx, a chemoattractant response, morphology, controvers, e.g. for detecting and isolating related sequences and for expressing antigenic peptides. Antibodies (Ab) directed against the protein and GPCRs are used to detect or purify the proteins; controvers, e.g. for developmental abnormalities); in screening for calcuminations or radioisotope) for Killing specific cells, and compounds to a toxin or radioisotope) for Killing specific cells, and compounds which bind them can be used to treat inflammation, e.g. asthma: as anti-idiotype antibodies. CKDLR201.1 protein and GPCRs and compounds which bind them can be used to treat inflammation, e.g. asthma: as antiviral agents, and to treat abnormal cell proliferation, regeneration, confidence 160 AA; soquence 160 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new macrophage derived chemotine, MDC, a member of the C-C (cys-cys) subfamily of cytokines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotraxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and angiogenesis. They may prove to be clinically important in the retarment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences.
                                                                      Pure or recombinant chemokine CKDLR201.1 - useful, e.g. for treating inflammation and as_antiviral agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-SEP-1997 (first entry)
Human macrophage derived chemokine analogue.
MDC, macrophage derived chemokine; C-C; Cys-Cys; Crohn's disease;
rheumatoid arthritis; chemotaxis; fibroblast proliferation;
wound healing; anglogenesis; inflammation.

Claim 17; Page 54; 60pp; English.

Purified heparanases, prepared under reducing conditions and activated with transjutaminase, are given in R70786-804. In peptide synthesis, a C-terminal peptide (R70805, encoded by cDNA sequence 085374) based on sequences for CTAP-III, platelet basic protein, beta-thromboglobulin and NAP-2, and an N-terminal peptide (R70809) based on CTAP-III and platelet basic protein were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inhibition of heparin or heparan sulphate degradation, by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 5; page 36; 60pp; English. Purified heparanses, prepared under reducing conditions and activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus

Stimulating bone growth in mammals with neutrophil activating peptide(s) - partic. for diagnosis and treatment of osteoporosis claim 1, Page 23; 45pp; English.

The sequences given in R86011-12 represent NAP-2V and NAP-2 which are a variant and the wild type form of neutrophil-activating peptide. These peptides were used in the method of the invention for increasing bone growth. NAP-2V is a cleavage product of the platelet alpha-granule component platelet basic protein (PBP). It is related to NAP-2 in that NAP-2V has an additional 5 amino acids at its N-terminal. The N-terminal of NAP-2V resembles the N-terminal of human bone stimulating factor. These peptides are useful in the diagnosis and treatment of osteoporosis.
                                                                                                        Gaps
                                                                                                                                                                                                                                                                                         NAP-27; NAP-2; variant; neutrophil-activating peptide; bone growth; cleavage product; human; bone stimulating factor; osteoporosis; platelet alpha-granule component platelet basic protein; PBP.

activating peptide-2 (NAP-2). NAP-2 is a potent neutrophil activating agent produced by the cathepsin D-mediated cleavage of the eleven N-terminal amino acids of beta-thromboglobulin. It may also be generated by the cleavage of two inactive precursors, connective-tissue-activating peptide III (CTAP-III) and platelet basic protein (RRP), which are stored in the alpha granules of blood platelets. NAP-2 or NAP-2 analogs, with homology of >80%, may be used to lower blood levels of irculating platelets and to reduce the clot forming abilities of these platelets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-DEC-1997 (first entry)
Neutrophil-activating peptide variant NAP-2V.
Neutrophil-activating peptide-2; NAP-2V; bone stimulating factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Purified heparanases, prepared under reducing conditions and activated heparanases, prepared under requent R70786-804. Most activated with transglutaminase, are given in R70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into PVIJ392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.

Stimulating bone growth in mammals with neutrophil activating stimulating bone growth in mammals with neutrophil activating peptide(s) - partic. for diagnosis and treatment of osteoporosis claim 1; Page 23; 45pp; English.
The sequences given in R86011-12 represent NAP-2V and NAP-2 which the sequences given in R86011-12 represent NAP-2V and NAP-2V and Invention for increasing bone growth. NAP-2V is a cleavage product of the platelet alpha granule component platelet basic protein (PBP). Is related to NAP-2 in that NAP-2V has an additional 5 amino acids at its N-terminal. The N-terminal of NAP-2V resembles the N-terminus of human bone stimulating factor. These peptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening for cpds, with anti-heparanase activity - by detecting inhibition of heparin or heparan sulphate degradation, potentially useful for treating arthritis, restenosis, cancer. Claim 5: Page 35; 60pp; English.
